

ReLearn: A Robust Machine Learning Framework in Presence of Missing Data for Multimodal Stress Detection from Physiological Signals

Arman Iranfar, Adriana Arza, David Atienza

Embedded Systems Laboratory (ESL), Swiss Federal Institute of Technology Lausanne (EPFL)

- Stress in modern societies
- Continuous and multimodal stress detection and recognition improves life quality [2]-[5]
 - Through wearable devices and embedded Machine Learning (ML) algorithms

ECG (Electrocardiogram)

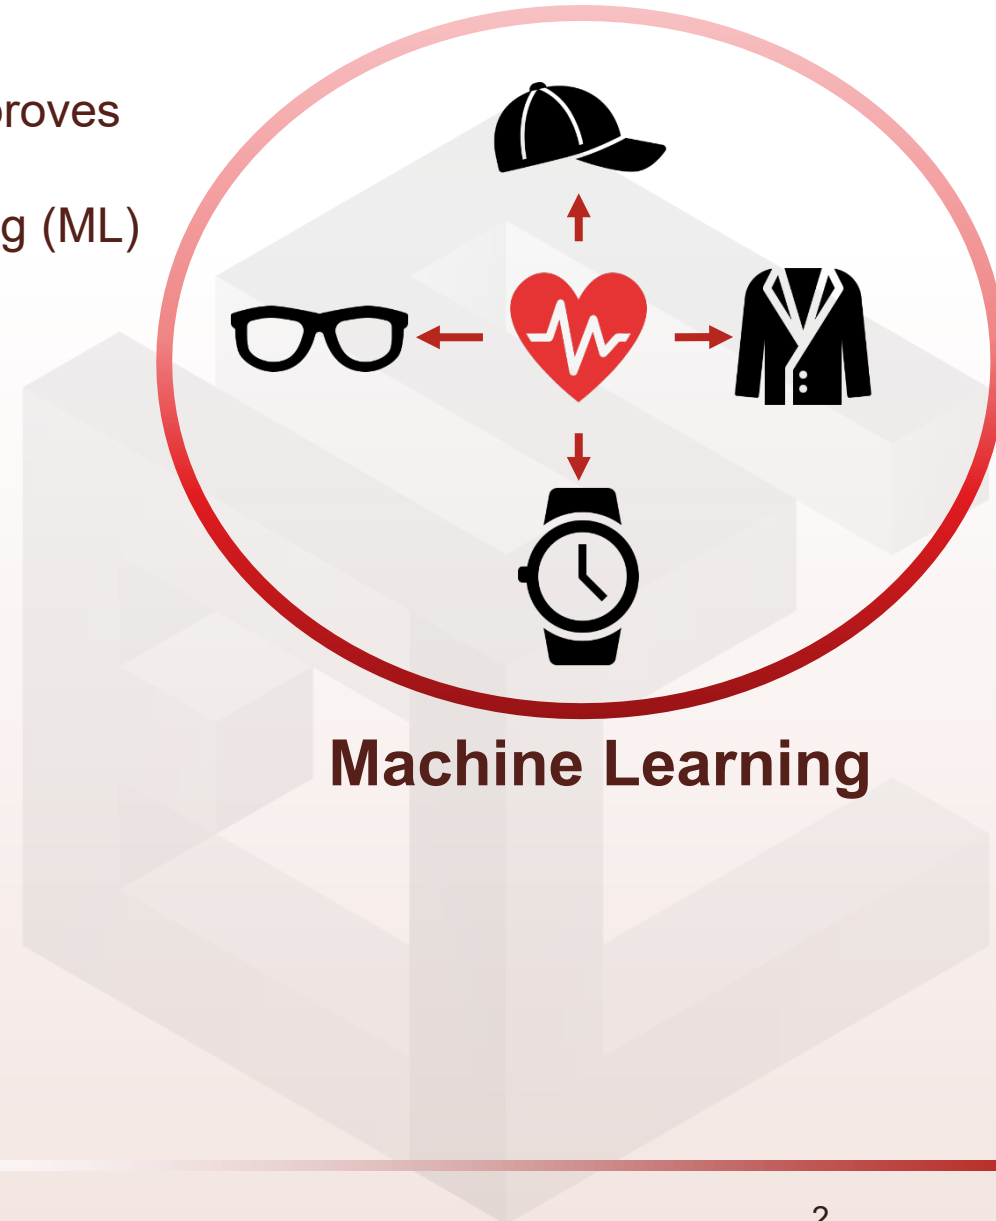

PPG (Photoplethysmography)

EDA (Electrodermal Activity)

RSP (Respiration)

- Common challenges of physiological signal acquisitions:

- Noisy data
- Missing data
- Outliers

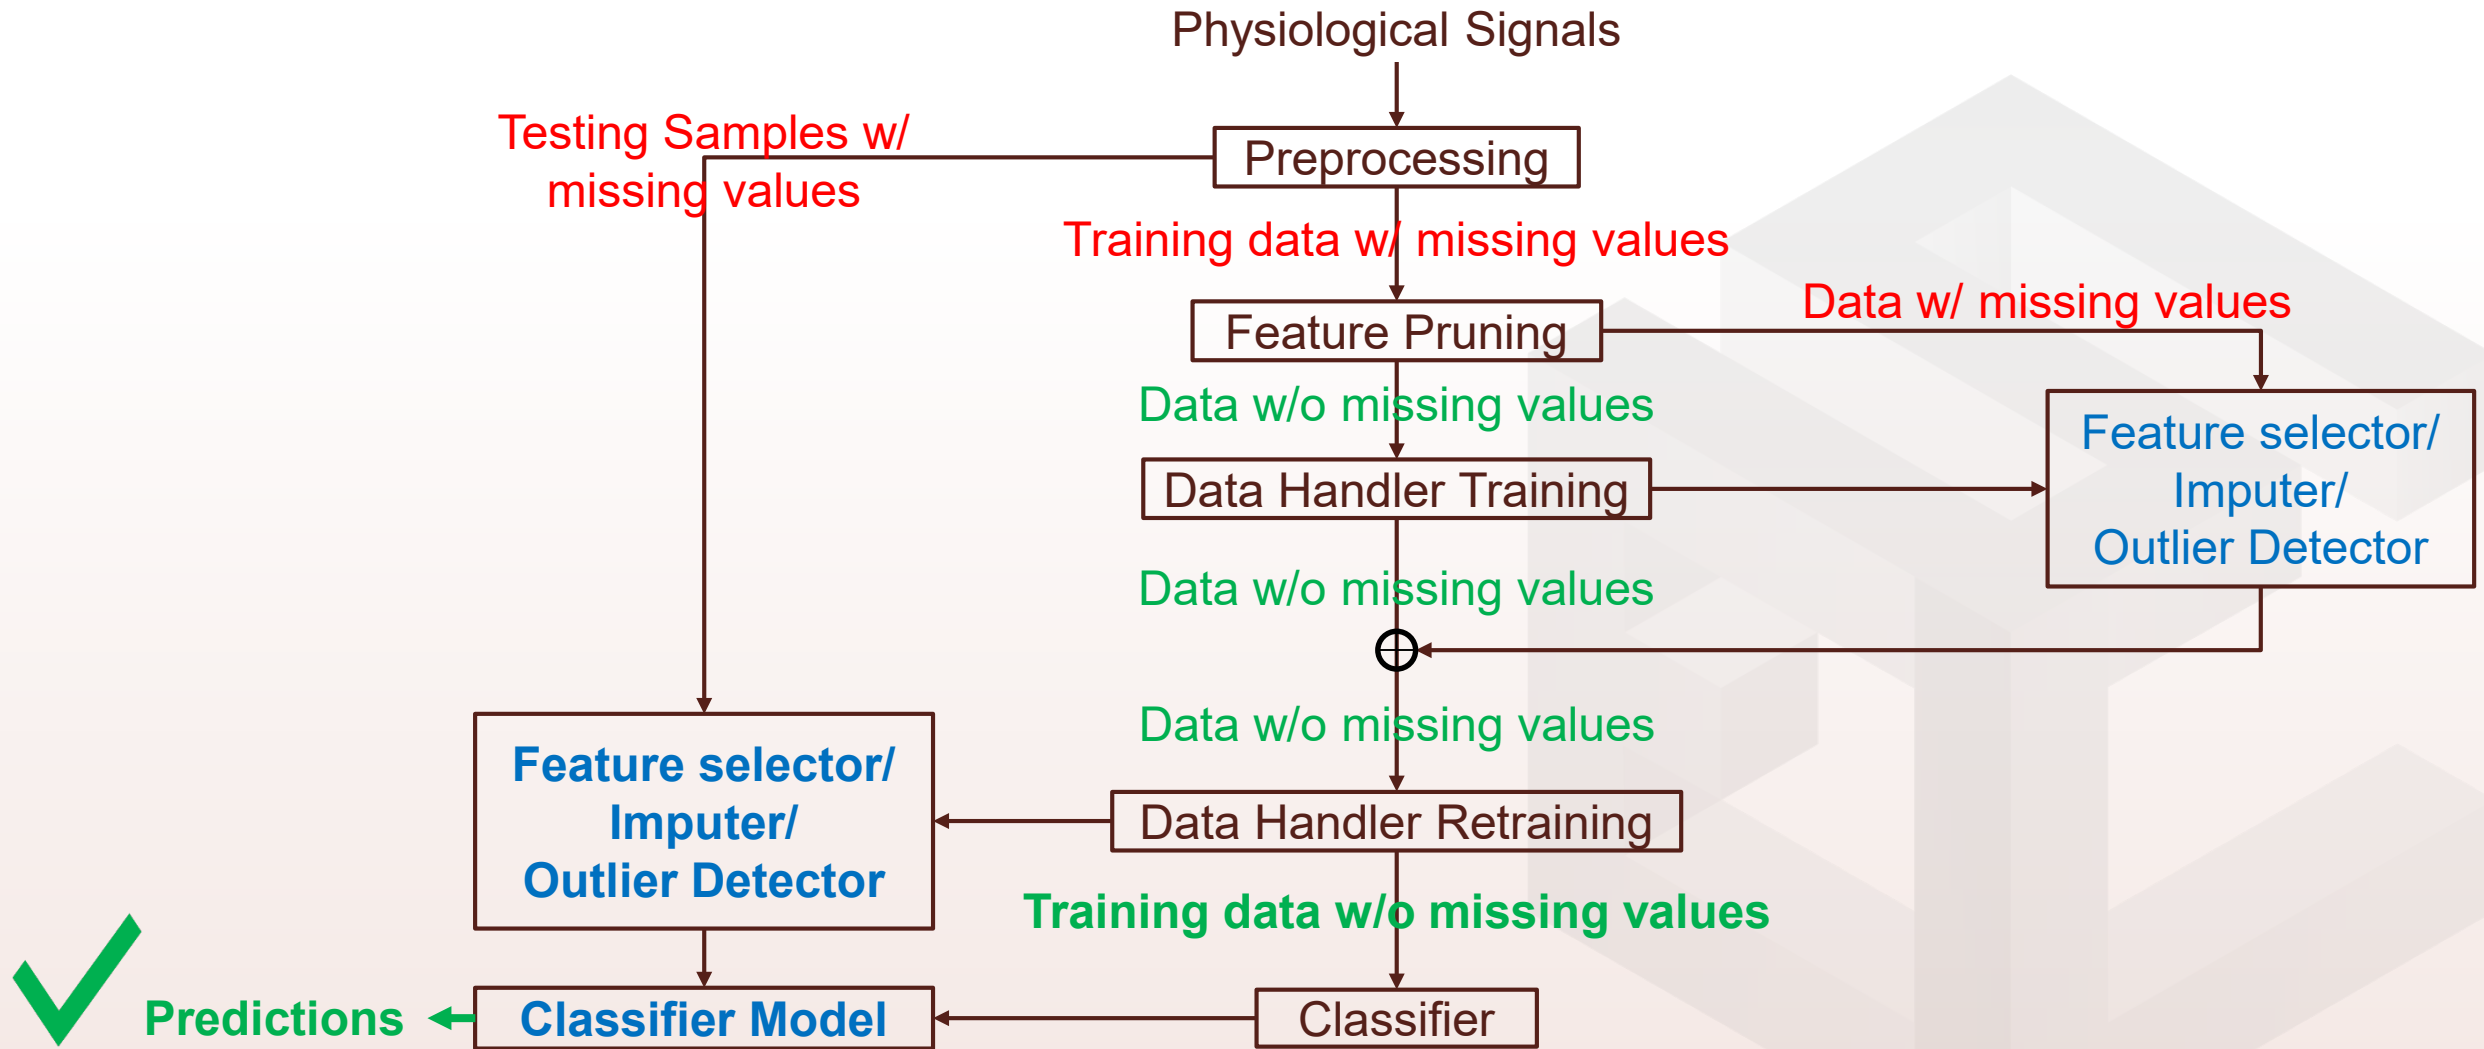

- Conventional remedies:

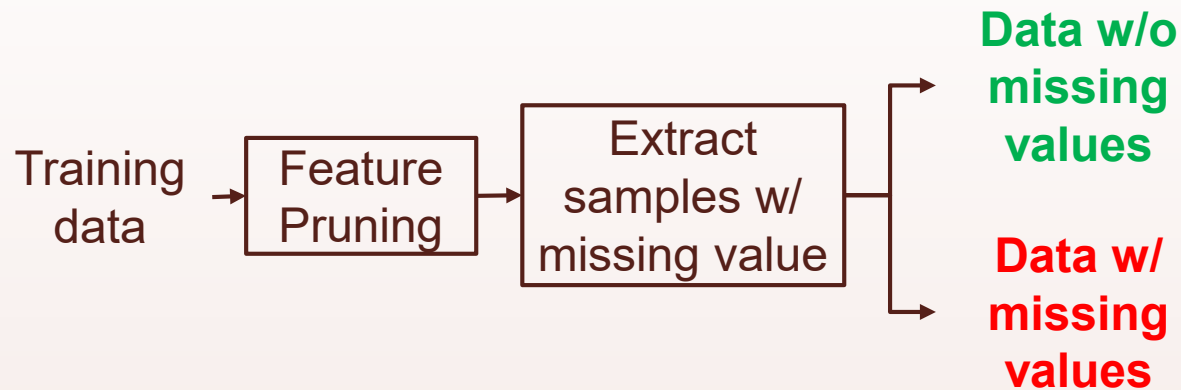

- Filtering
- Ignoring imperfect data and outliers
- Data imputation
 - Last value
 - Mean/median value
 - Constant value

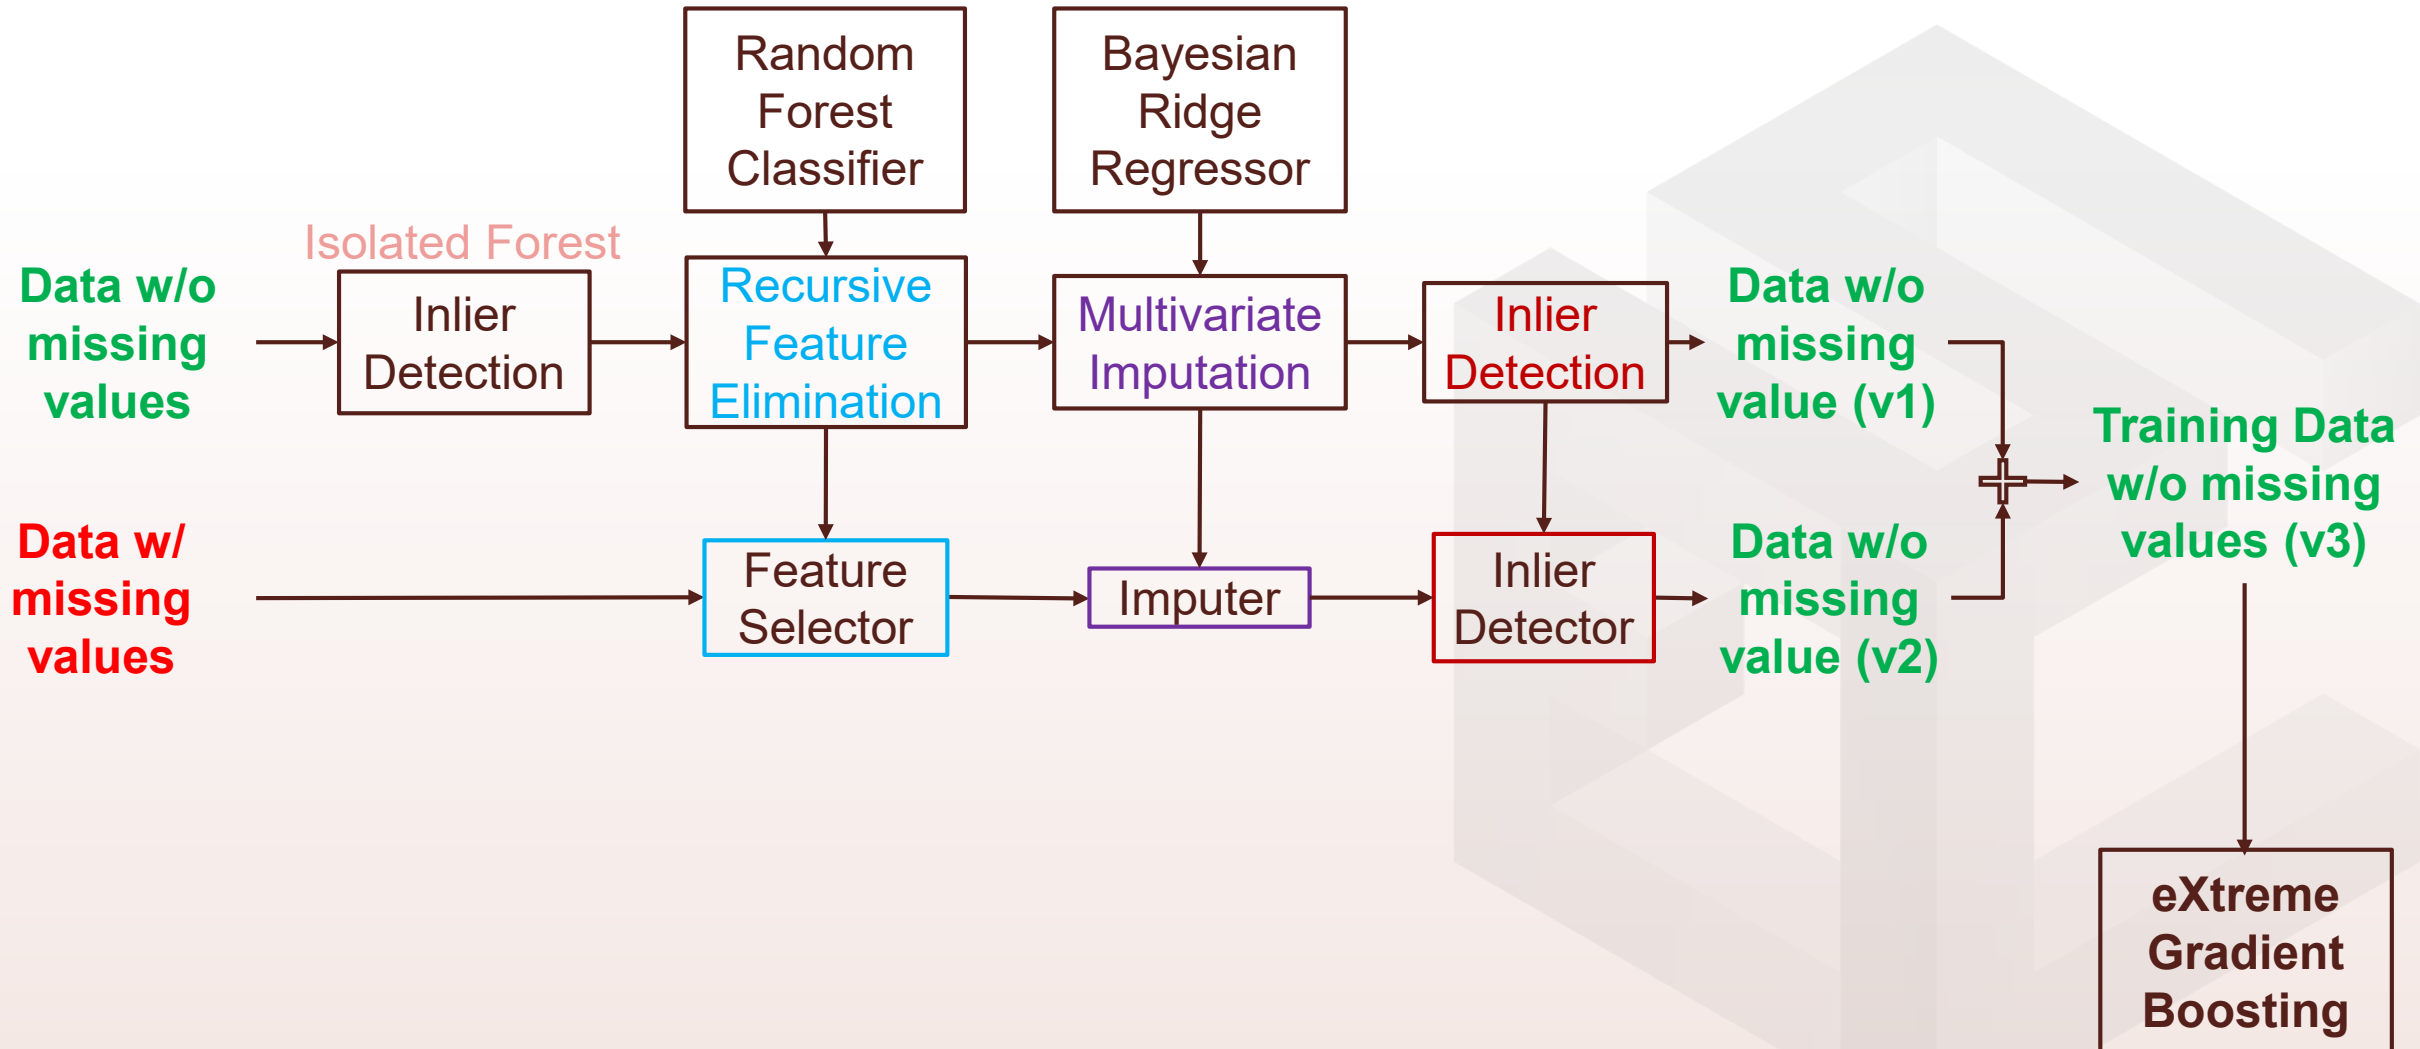

- No prediction for discarded segments
- Reduced prediction accuracy due to lack of sufficient data, esp. in Machine Learning solutions
- Reduced prediction accuracy due to inaccurate data

A more comprehensive solution is required to deal with outliers and missing data!

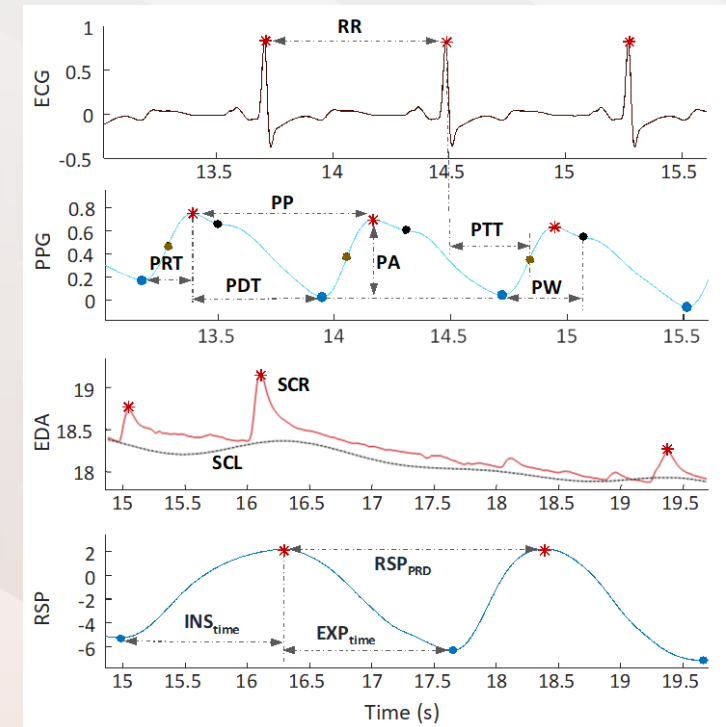

- **Feature Pruning: remove a feature if more than x% of its samples are missing**
 - **Hyperparameter to tune**

- Experimental Protocol:
 - 95 participant, male and female
 - Divided to two groups performing **stress** and **control** tasks
- Database:
 - ECG, PPG, EDA, RSP
 - 94 physiological features in the time and frequency domains extracted from time series in segmentation windows of 60s.

- With lower threshold, more features and samples are dropped: cleaner, but less data!
- With larger threshold, less features and samples are dropped: more unclean data!
- **Tradeoff required!**

| | CV (mean ± STD) | Inf. (All) (mean ± STD) | Inf. (Miss.) | #Feat |
|-----------------|----------------------------------|--|-------------------------------|--------------|
| Drop NaN [13] | 81.6 ± 12.0% | 74.4 ± 30.0% | N/A | 24 |
| Mean Value [12] | 53.9 ± 13.5% | 50.2 ± 38.7% | 51.1% | 49 |
| Last Value [12] | 54.1 ± 12.4% | 49.7 ± 38.2% | 50.5% | 36 |
| ReLearn | 86.8 ± 6.4% | 78.8 ± 25.4% | 77.9% | 38 |

- Machine learning algorithms require sufficiently large and clean data.
- Removing data with missing samples or using conventional imputation techniques lead to inaccurate prediction, especially for datasets with limited number of samples
- We proposed ReLearn, a machine learning framework for multimodal stress detection from physiological signals in presence of missing data and outliers
- Compared to conventional imputation techniques, ReLearn improved prediction accuracy by at least **26%** for missing samples.
